Fish nondescripton at the Vair Montal 4 March 1861 I saw a Tish of about 14 miche, In of the species of the sed wife or Suching fich but more in form like a very thick farge. News the Sher dried, and enclear of Common fish Scales it has plate, of perfect Goory - The head and Jack fin of soles worn - In the your fan only Two feet like the furt beak of a zony chit. - The Plates resembles those of a Phinem as unceasthe described - The Plates coupe 3 nows in ois one on the back & how who belly - The intervals were felled with imply

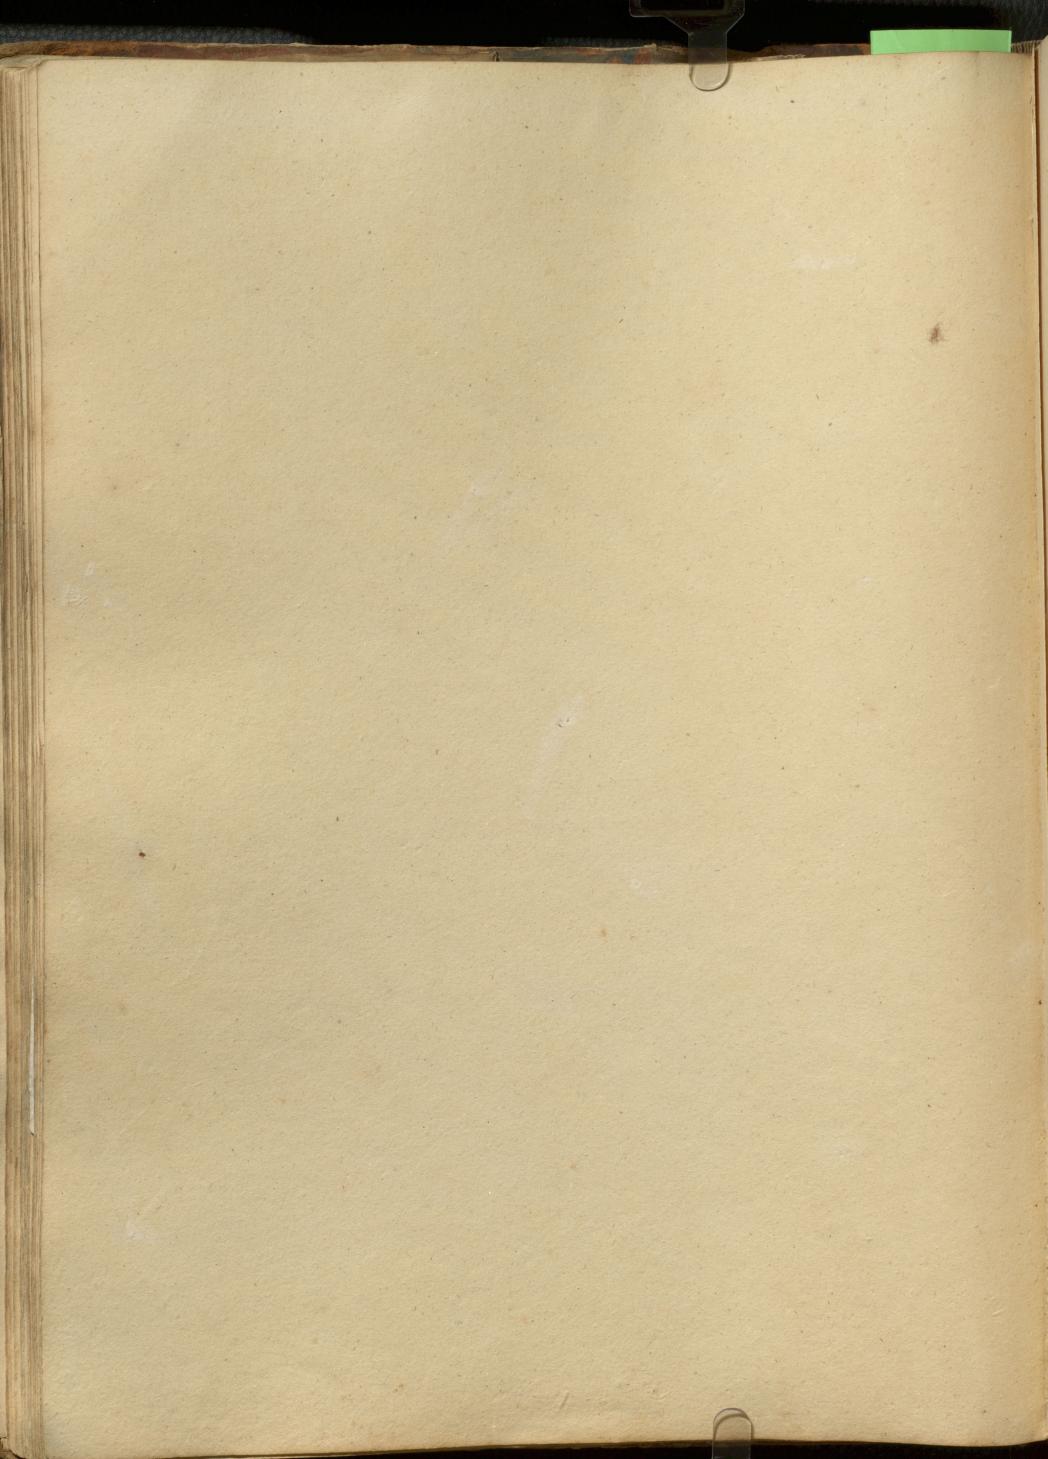

Diones scales of ivong. The fish by the Sect hand be going - if is conti grow & the sore of a whole Long It much de dond of The Ocean. The every fins were told every for plate moderately Porous. Bong substance with how you fich. It Jans bong process withing teeth. I rong process withing teeth. more of hory from

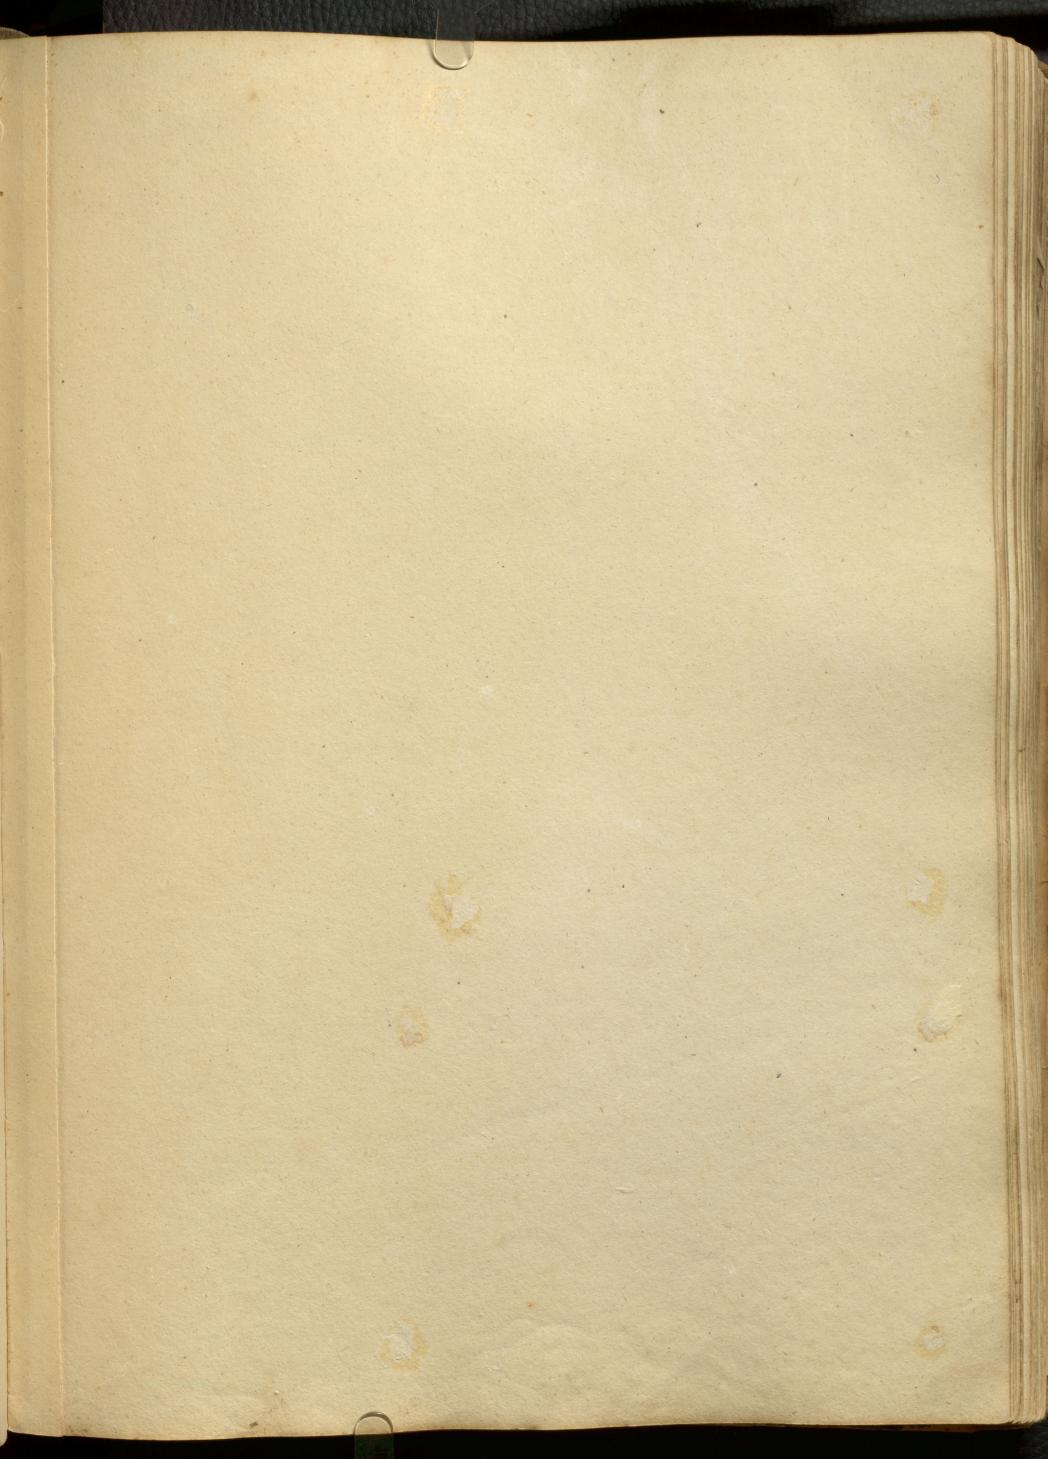

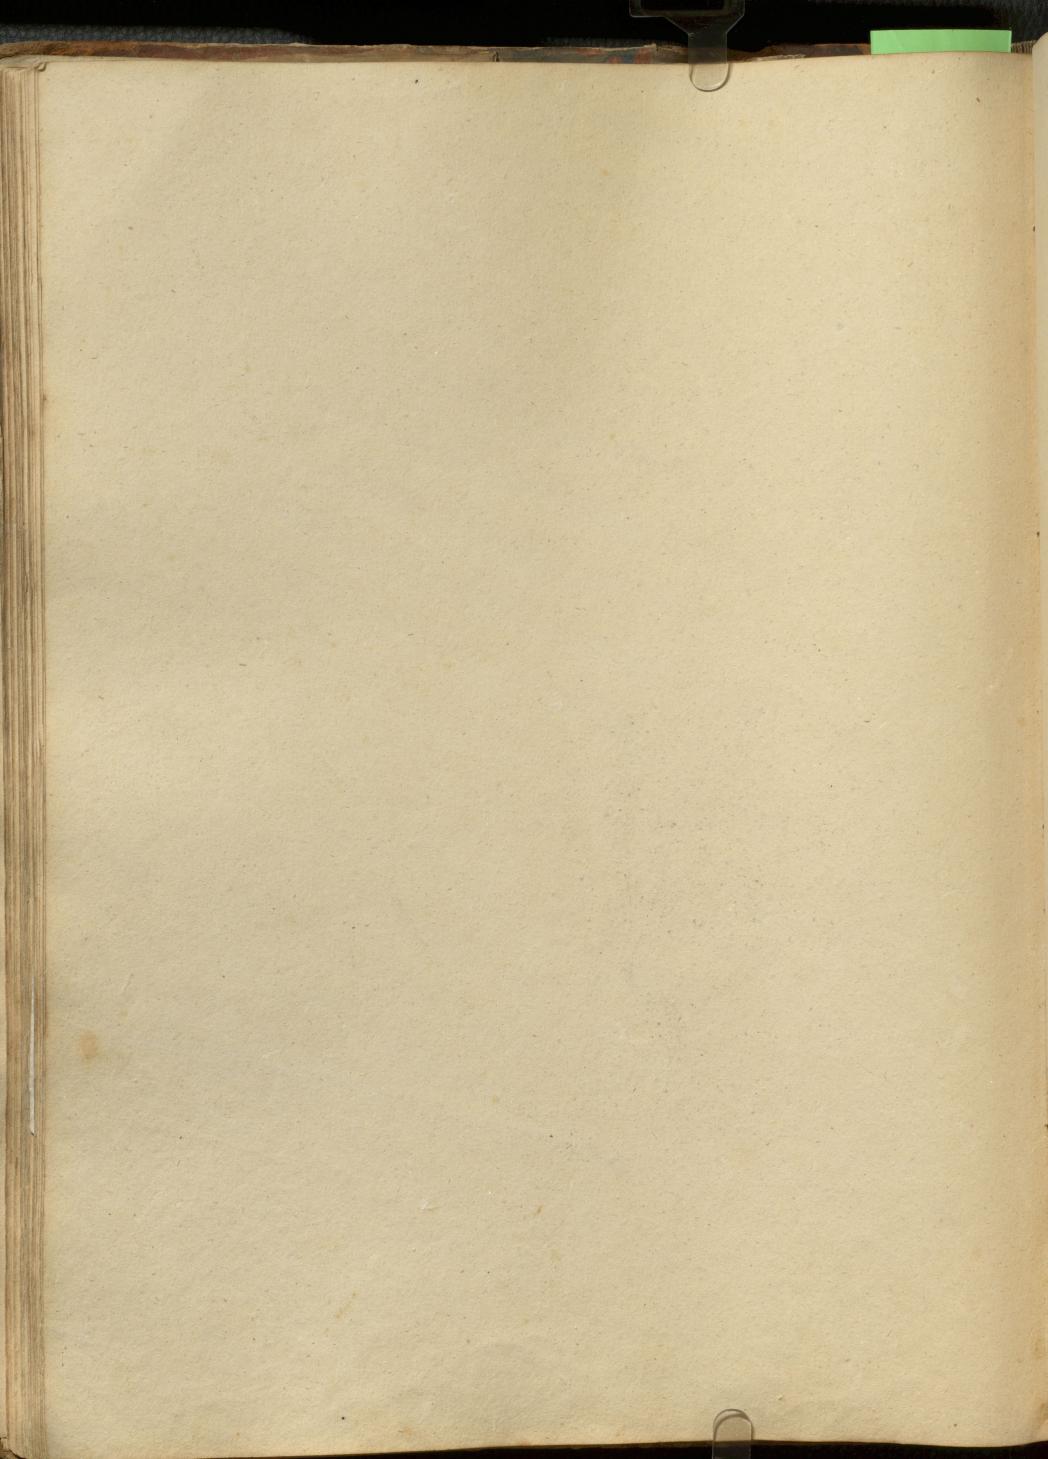

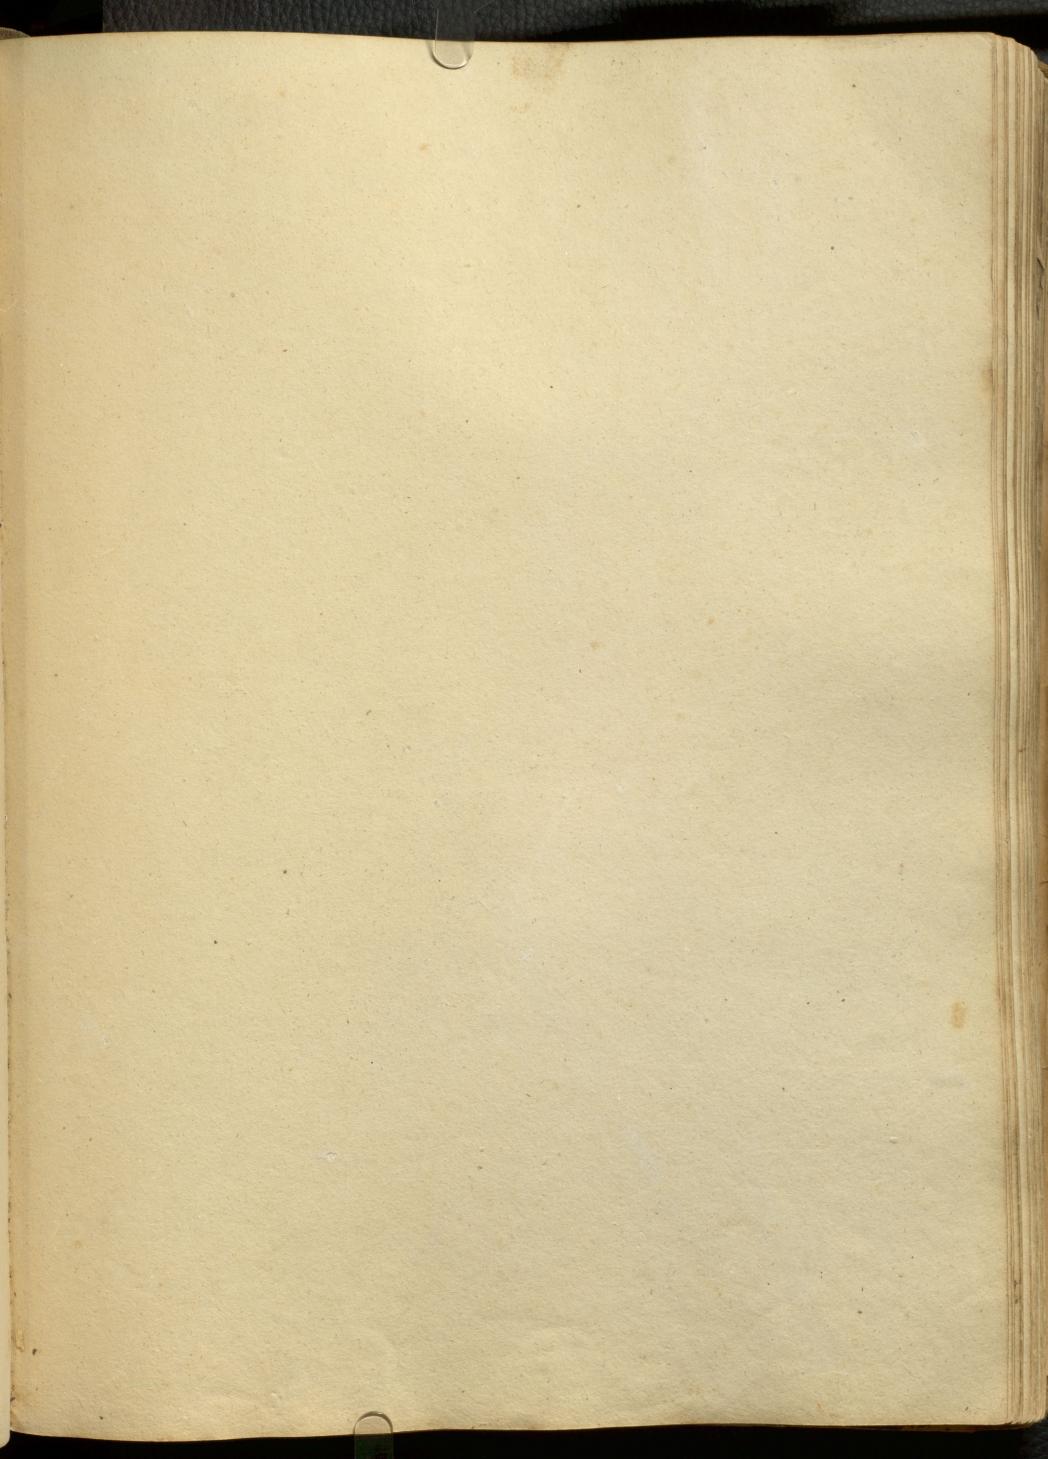

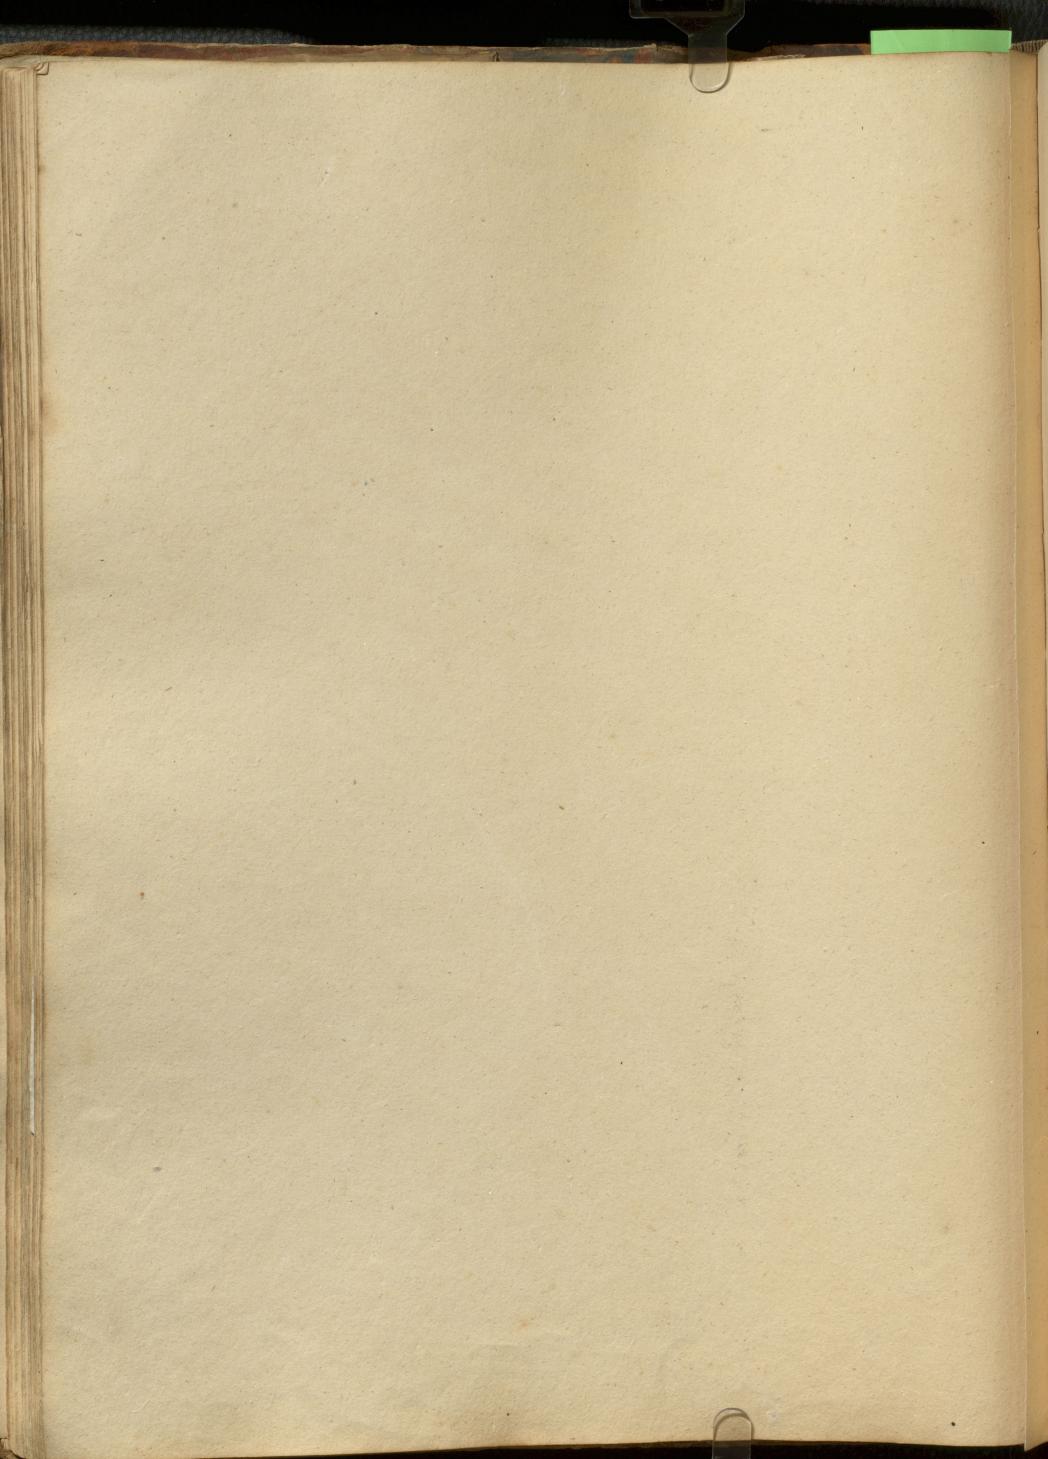

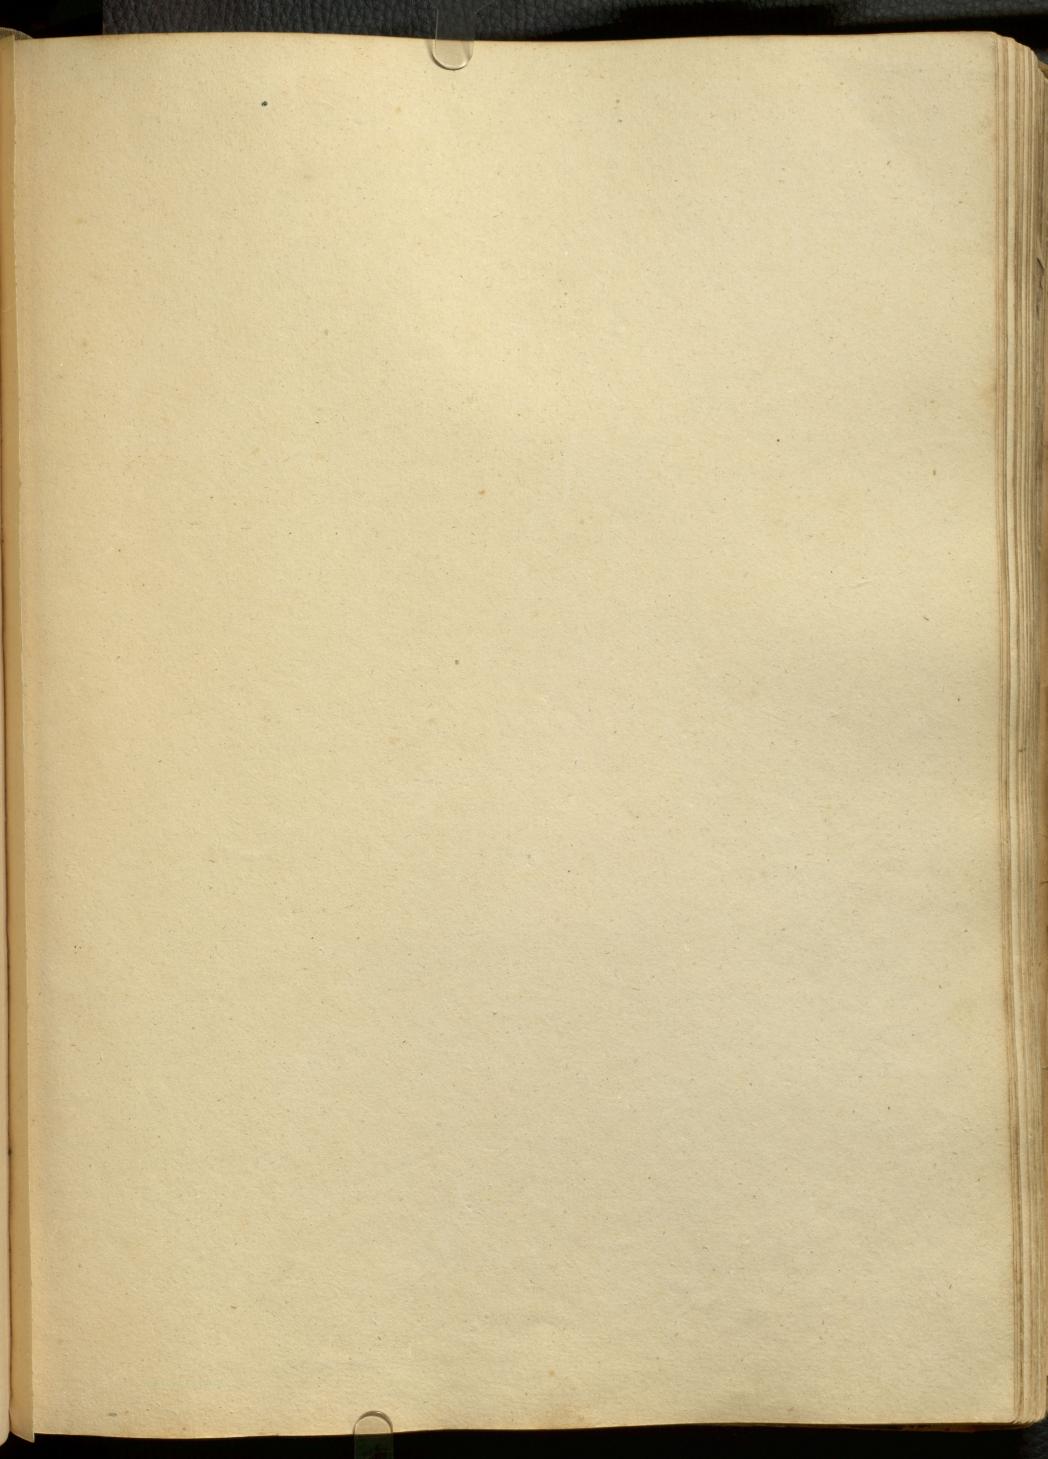

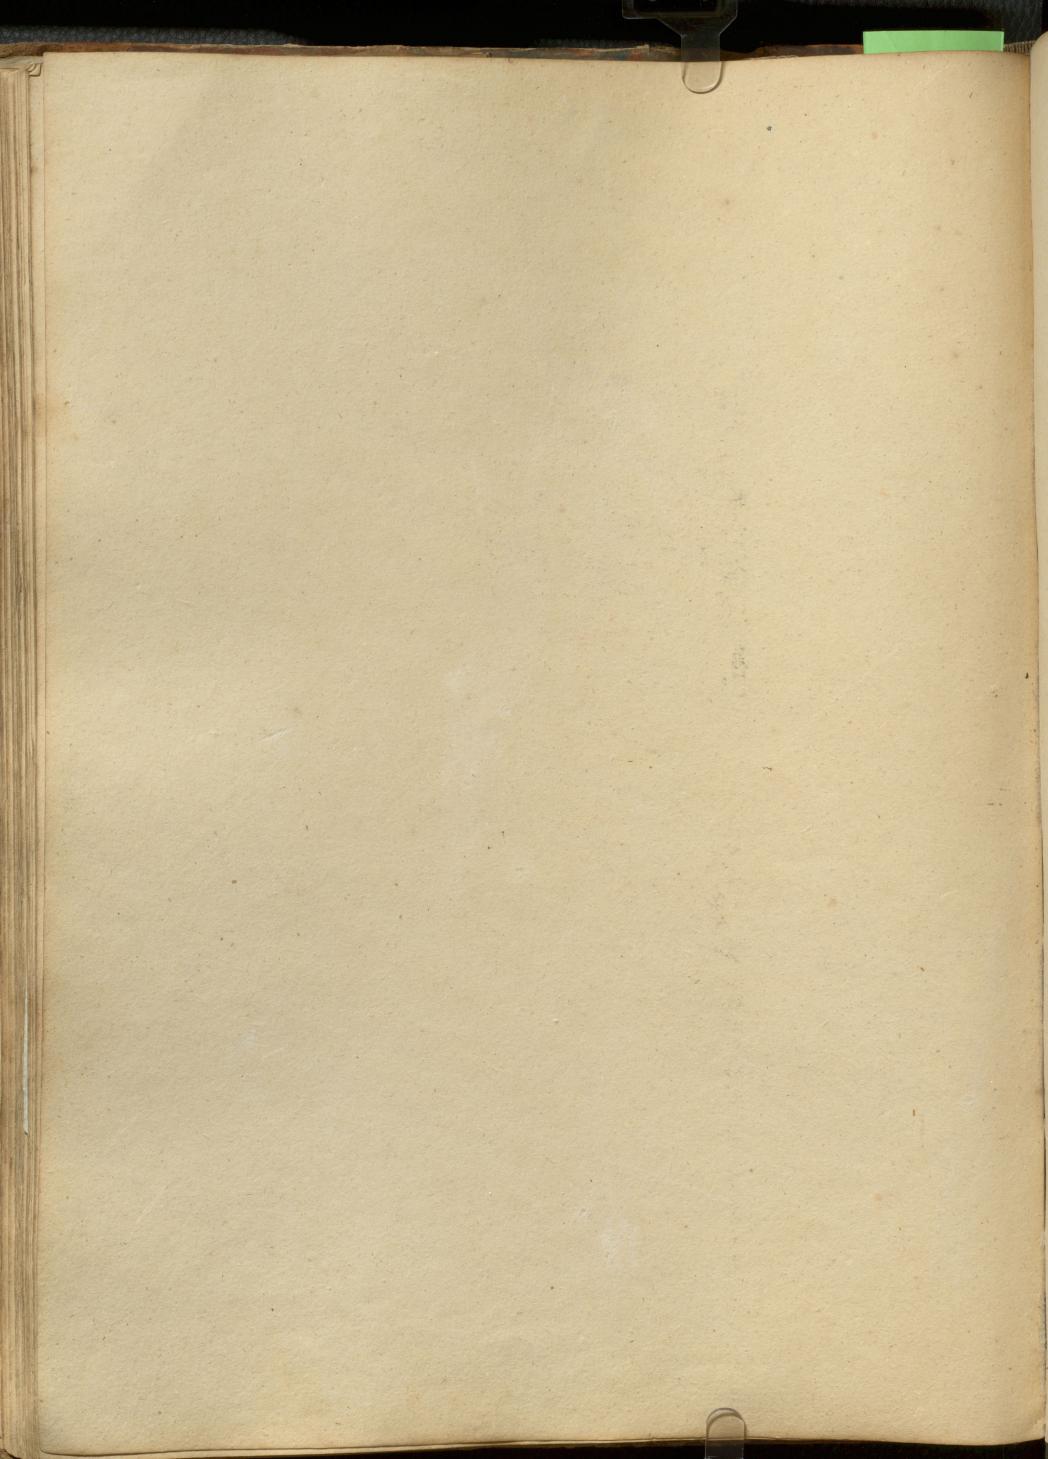

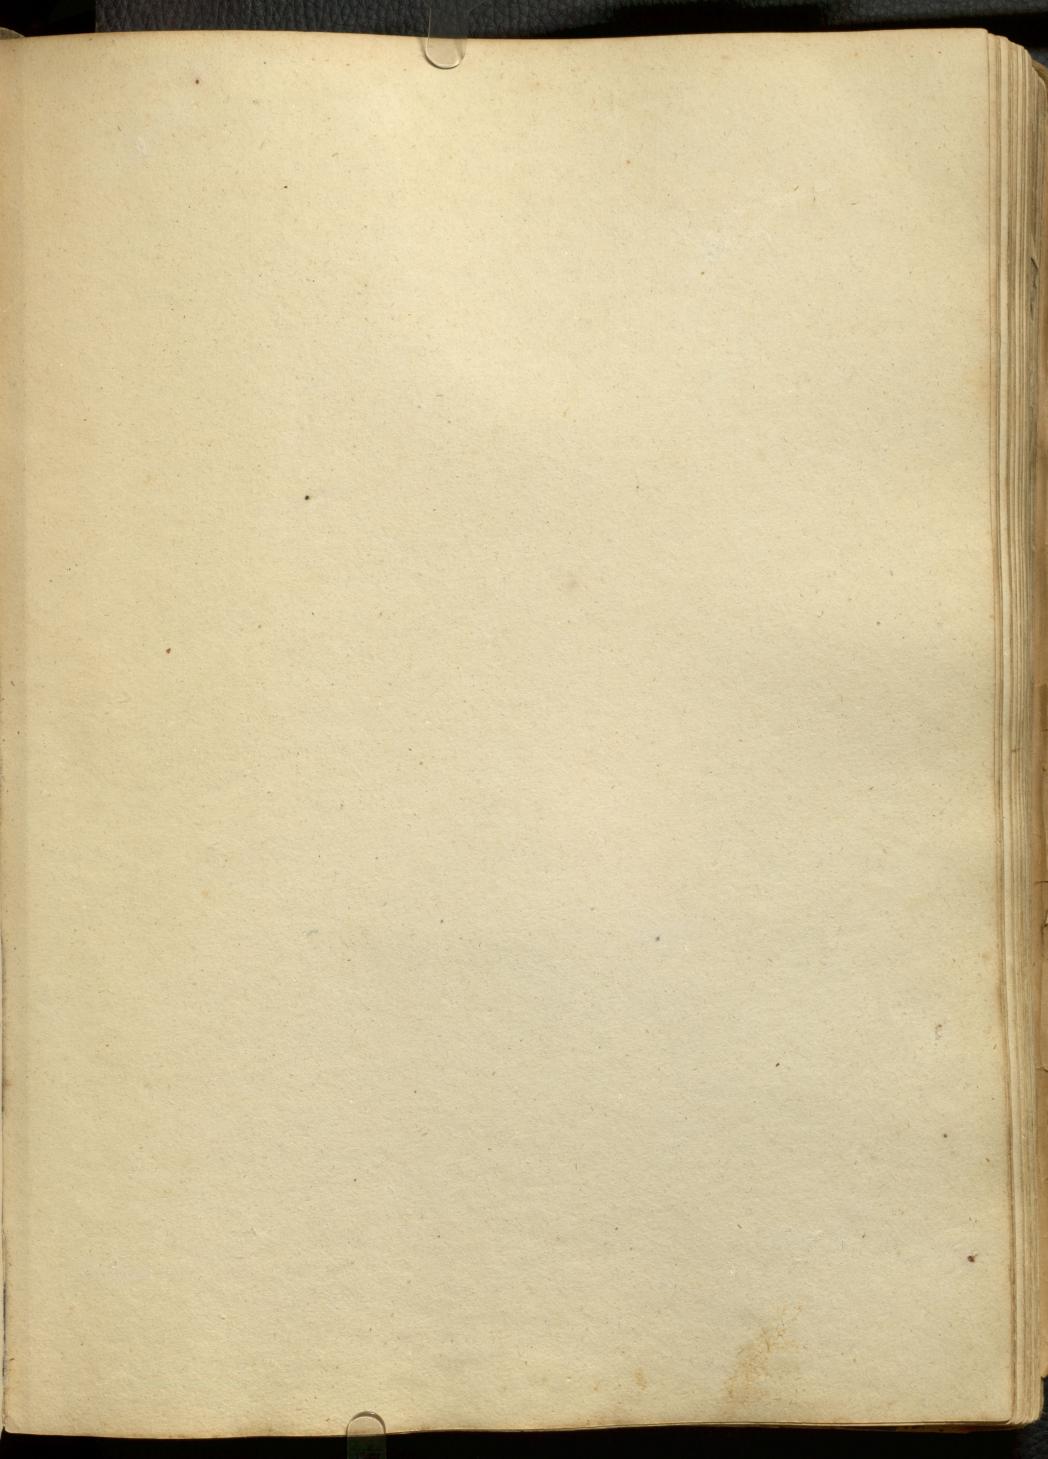

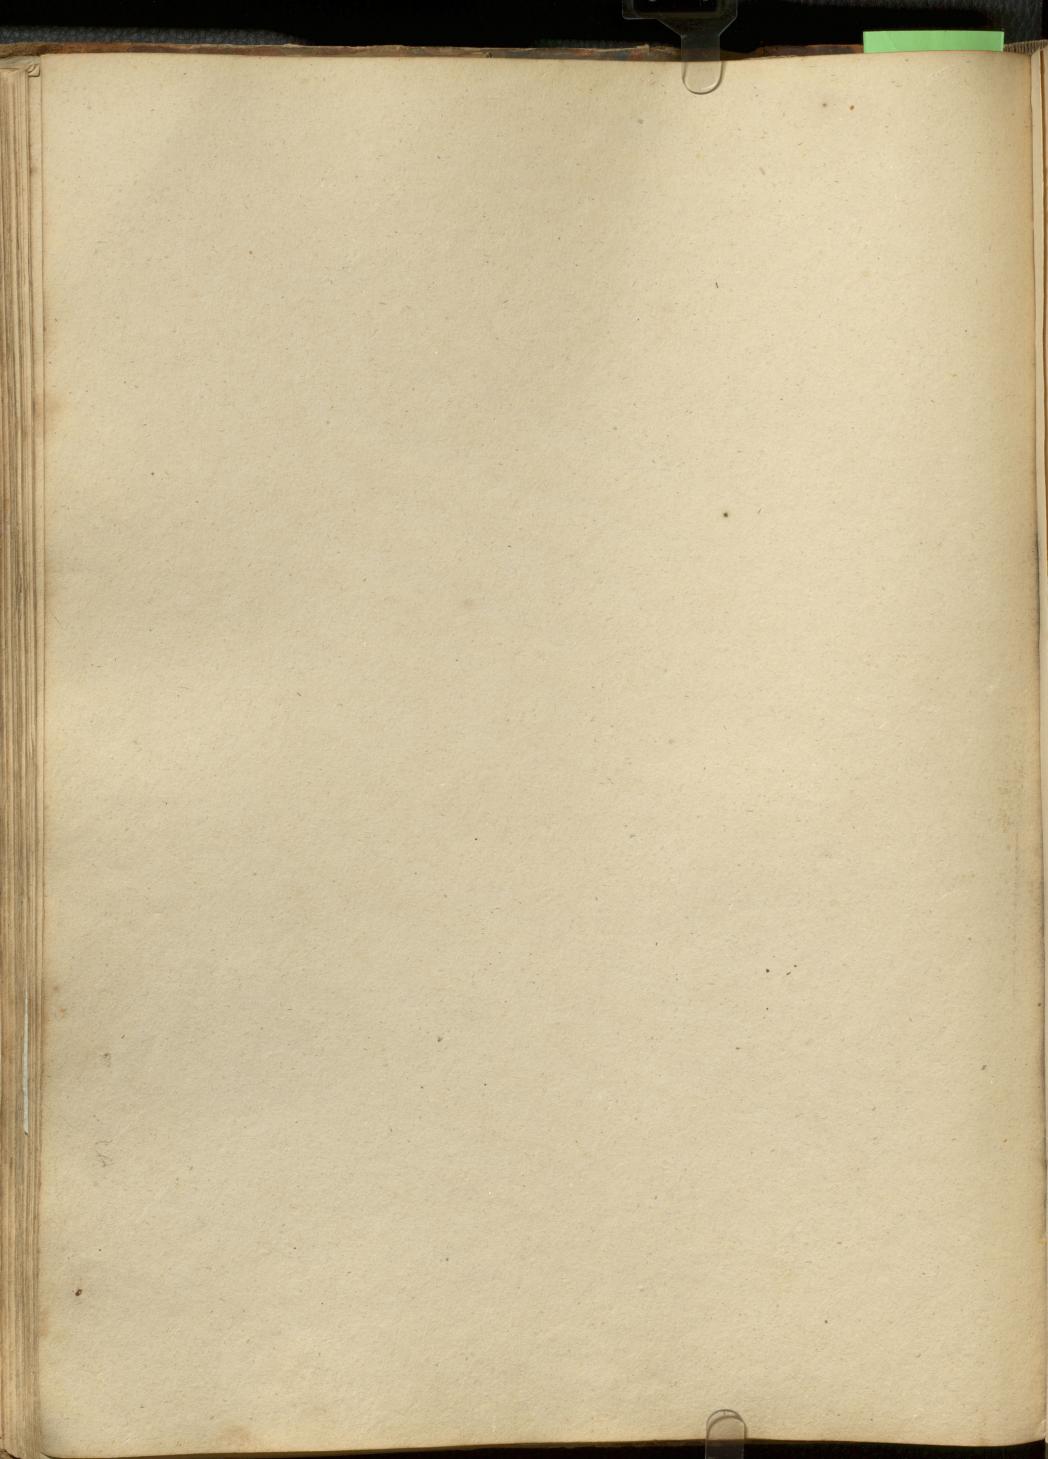

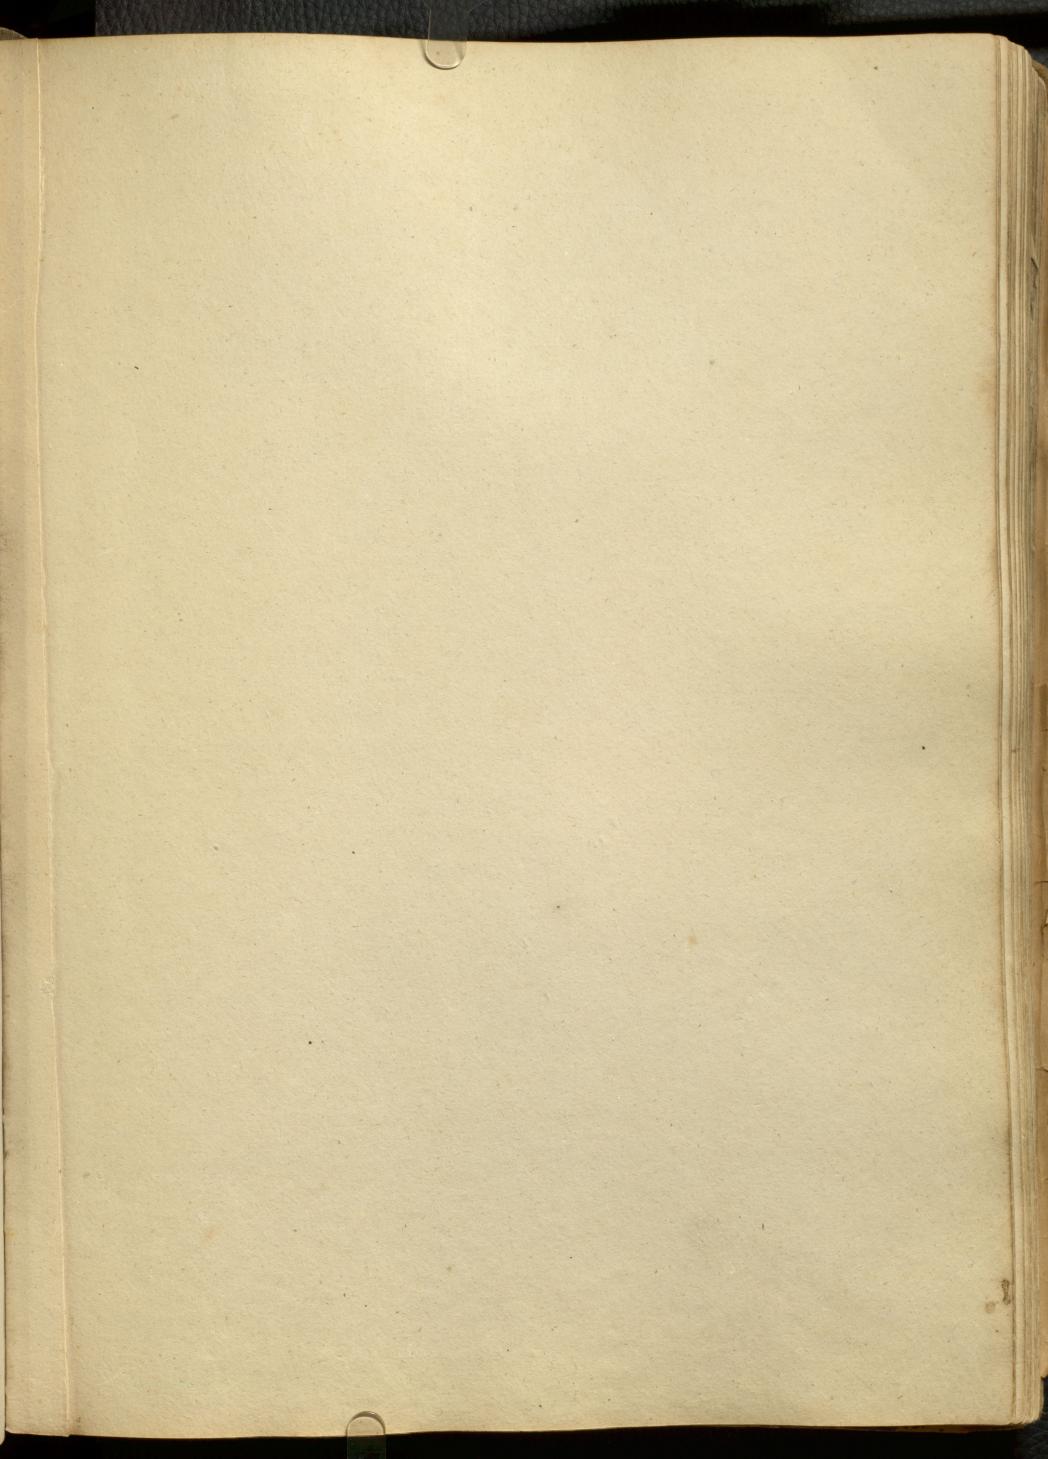

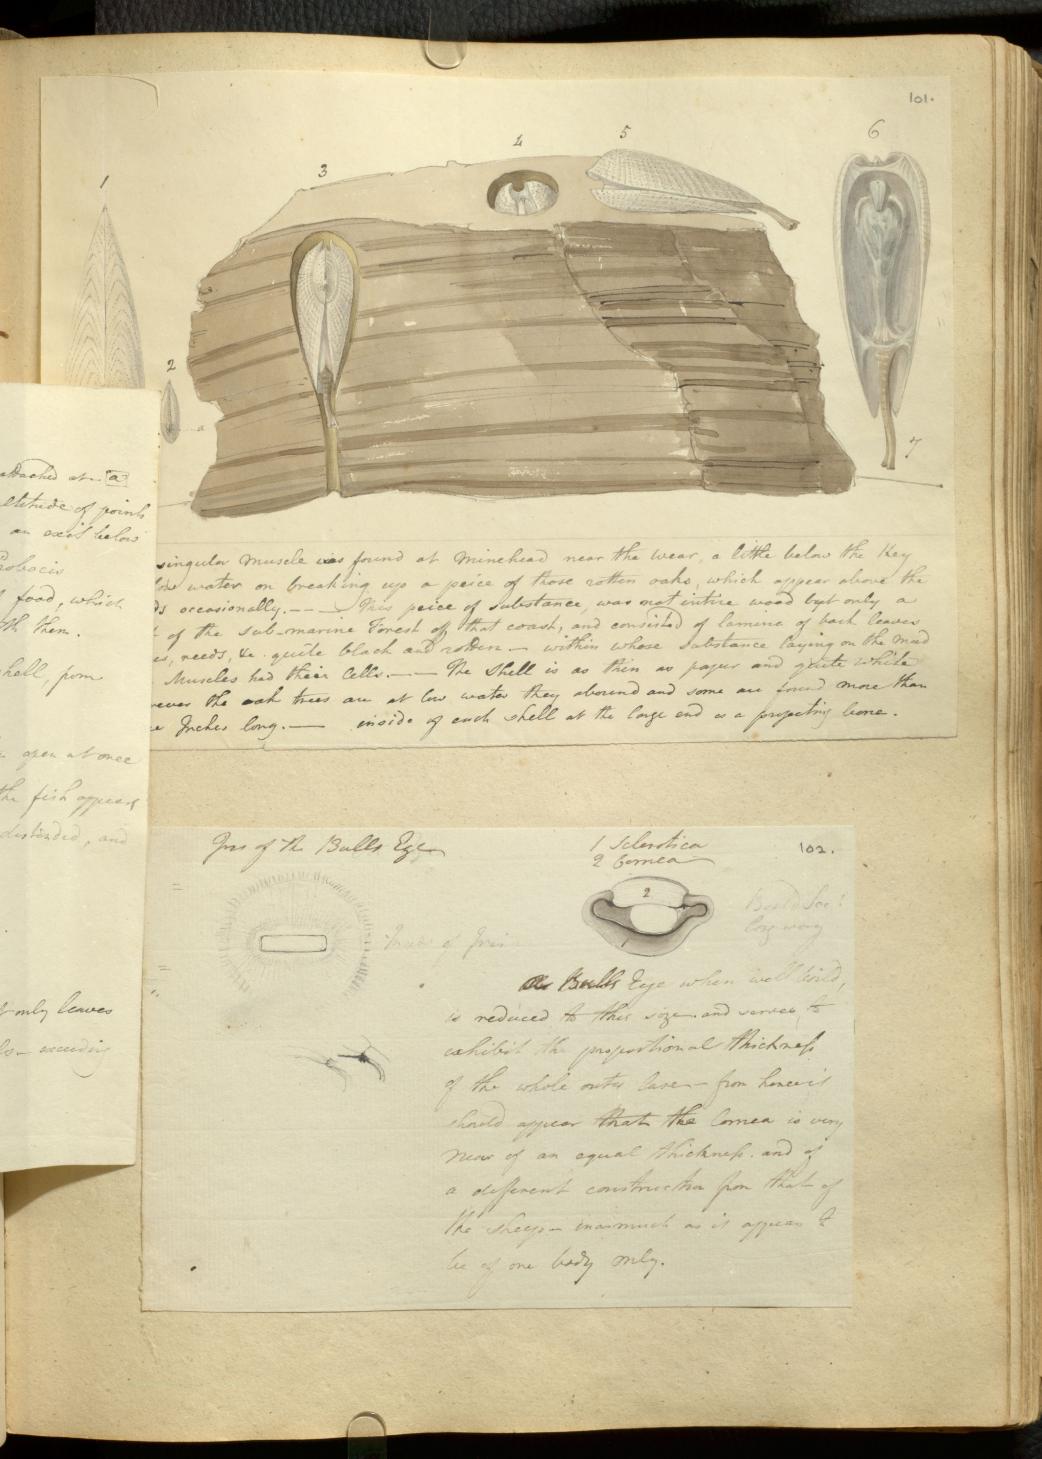

1. The Shell closed at the upper and, seen from behind 2. The little seperate shell, which covers the hinge, and is elightly abached on a 3. The muscle in its cell, worn into shape by means of the multitude of po or thoms that cover the whole back of the Shell - The Cell has an excelle towards the day as sand, a perfect trube, into which the Probacio exactly overembling that of an Elephant, descends in search of food, while for found with them. 4. a call opened at the top, with its inhabitant opening the shell, from whence it sports water on being disturbed and vetires. 5. A musile laying sideways to shew that both ends are ofen open also 6. The shell grend by diording the pont integument, when the fish of in the form of an Egypthan Mummy. The closing muste distinded, The probocis doctordes 4. The Probocis of a dull brown colour, leathery, and writed. On seperating these Makes of leaves and wood, with a Penking, not only lear and forend but fillament of Sulphers, as in some welch loads - exceed bright and silvery.

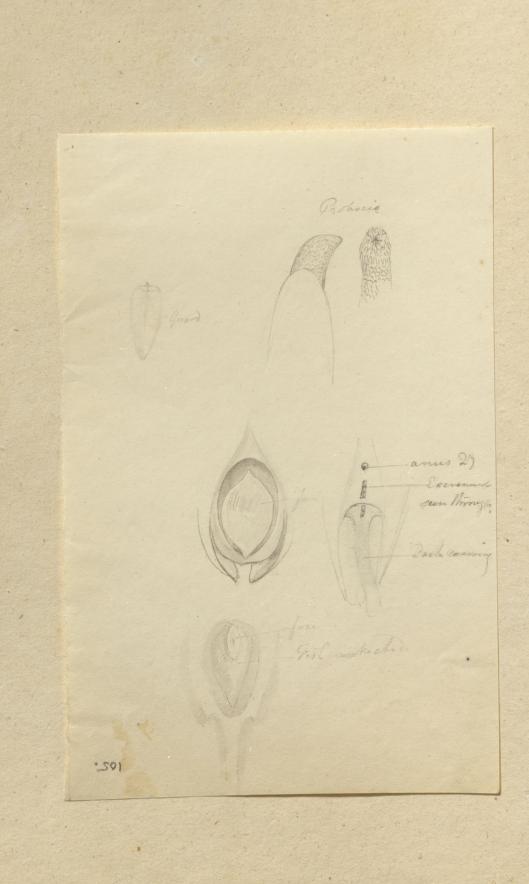

1. The Shell closed at the upper and veen 2 . The little seperate shell, which covers the 3. The muscle in its Cell, worn into shape or thoms that cover the whole back of the towards the clay or sand, a perfect this exactly oresembling that of an Elephanh, instably are a spocies of Centrapides, as 4. a cell opened at the top, with its inha whence it sports water on being distur 5. A muscle laying sideways to shew that 6. The shell grend by dividing the pont in the form of an Egypthan Mummy. The probocis doctorded 4. The Probocis of a dull brown colour, & On sequenting these Makes of leaves and wood, and found but fillament of Sulphers, as

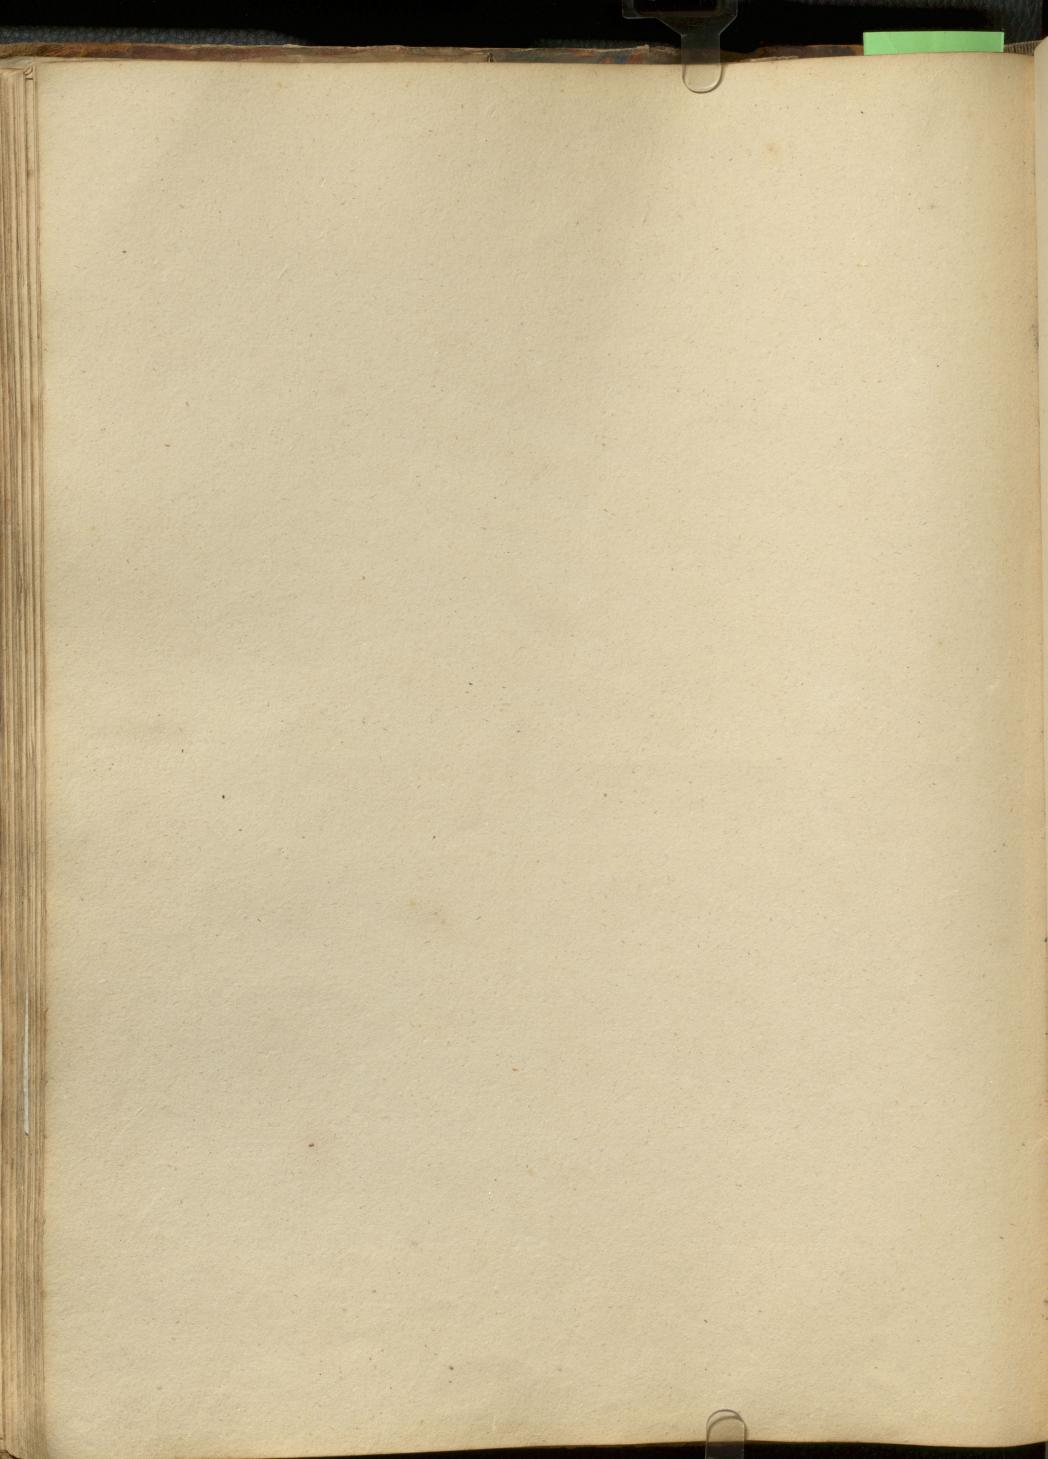

This singular muscle was found at minehead near the wear, a little below the Key at low water on breaking up a peice of those rotten oaks, which appear above the sands occasionally. - This peice of substance was not intire wood byt only a part of the Sub-marine Forest of that coash, and consisted of lamine of back leaves of trees, reeds, the quite black and rothers ... within whose Substance laying on the med these Muscles had their Cells. - The Shell is as this as paper and greate while where wherever the oak their are at low water they abound and some are found more than there Inches long. - inside of each shell at the large end as a forgacting lione.

Joseph Balls Egen 102.

But Bulls loge when well hind, is reduced to this size and verice to which affect appear that the Comen is way new of an aqual thickness, and of the sheeps inaimned as is aquan to the sheeps inaimned as is aquan to be of one body only.

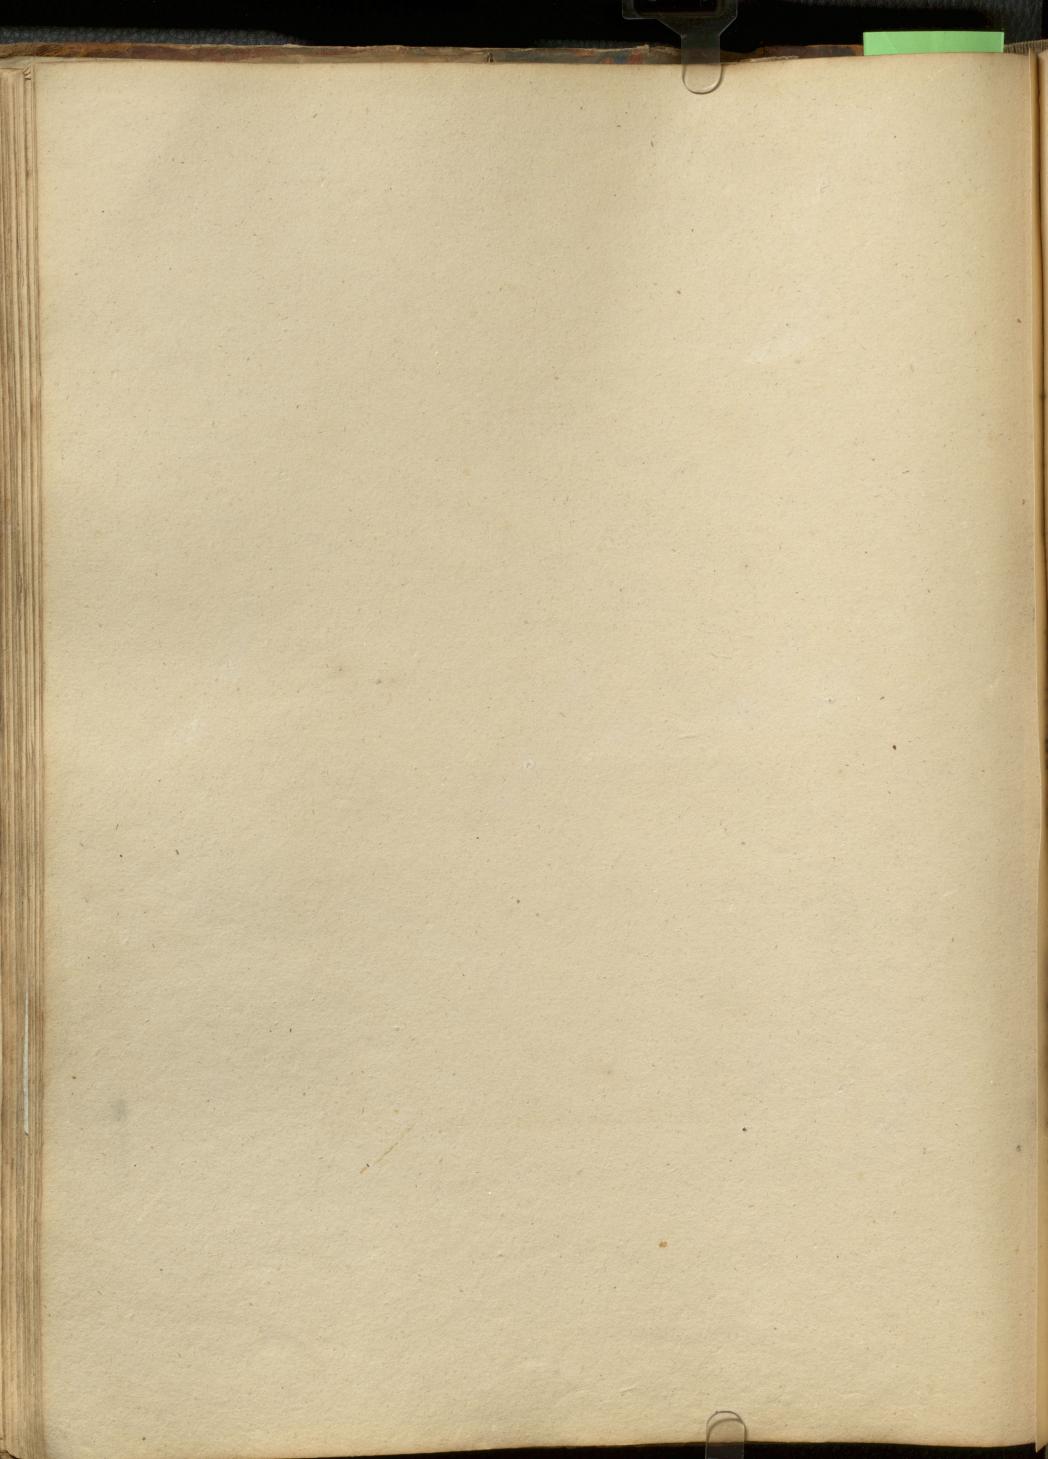

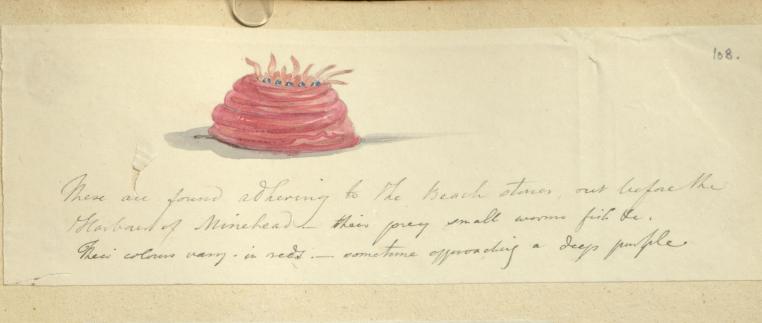

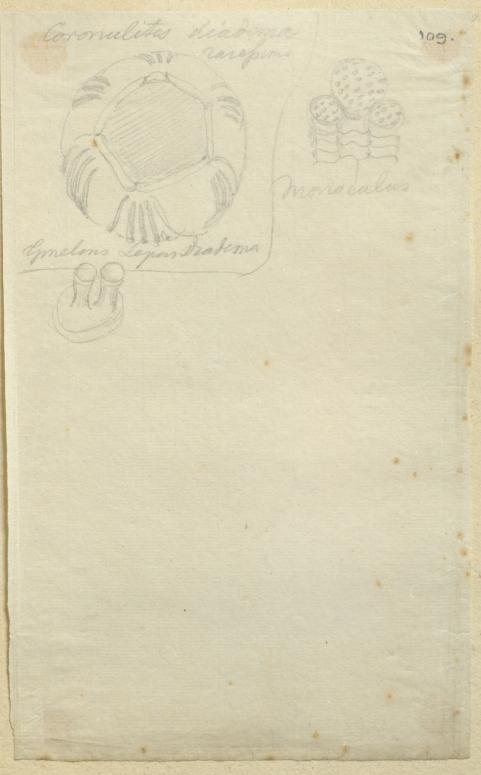

On other stones I saw known dengih of this form. I and ouze in all other respect resembling the sea dimpets . - also on More stones that were partly out of water were many brock Inacle of all sozies from with desesson get ligher oval and Cercular bour open to the Mese mails when put into a repel, seemed always to delight in being offen onto the water but sometimes sant to the bottom. in the water their Andrian seemed offen to les lively especially when thes came ligather and some were much darker than others. They havel by means of a lat of fin place where the Anaels have Hear hans very fast in a glass of water, but always availing themselve Me deder of Meglate - They they appear when the havelling The value that closes the aperture of the Pernwincle, attached to the Jish by the convex side, fine a paper of the edge, thich as a human mail at the place of attachement, of a horny substance twisted to and minches in abundance under the Beach stones ar low water, - and with a little salt east very well. They are defferent from the Sort that whach themoelues to the brocks of the Channel about wester super Trave. Pernium ble of the natural size They are prodigion, stry to result the stones of the Buch

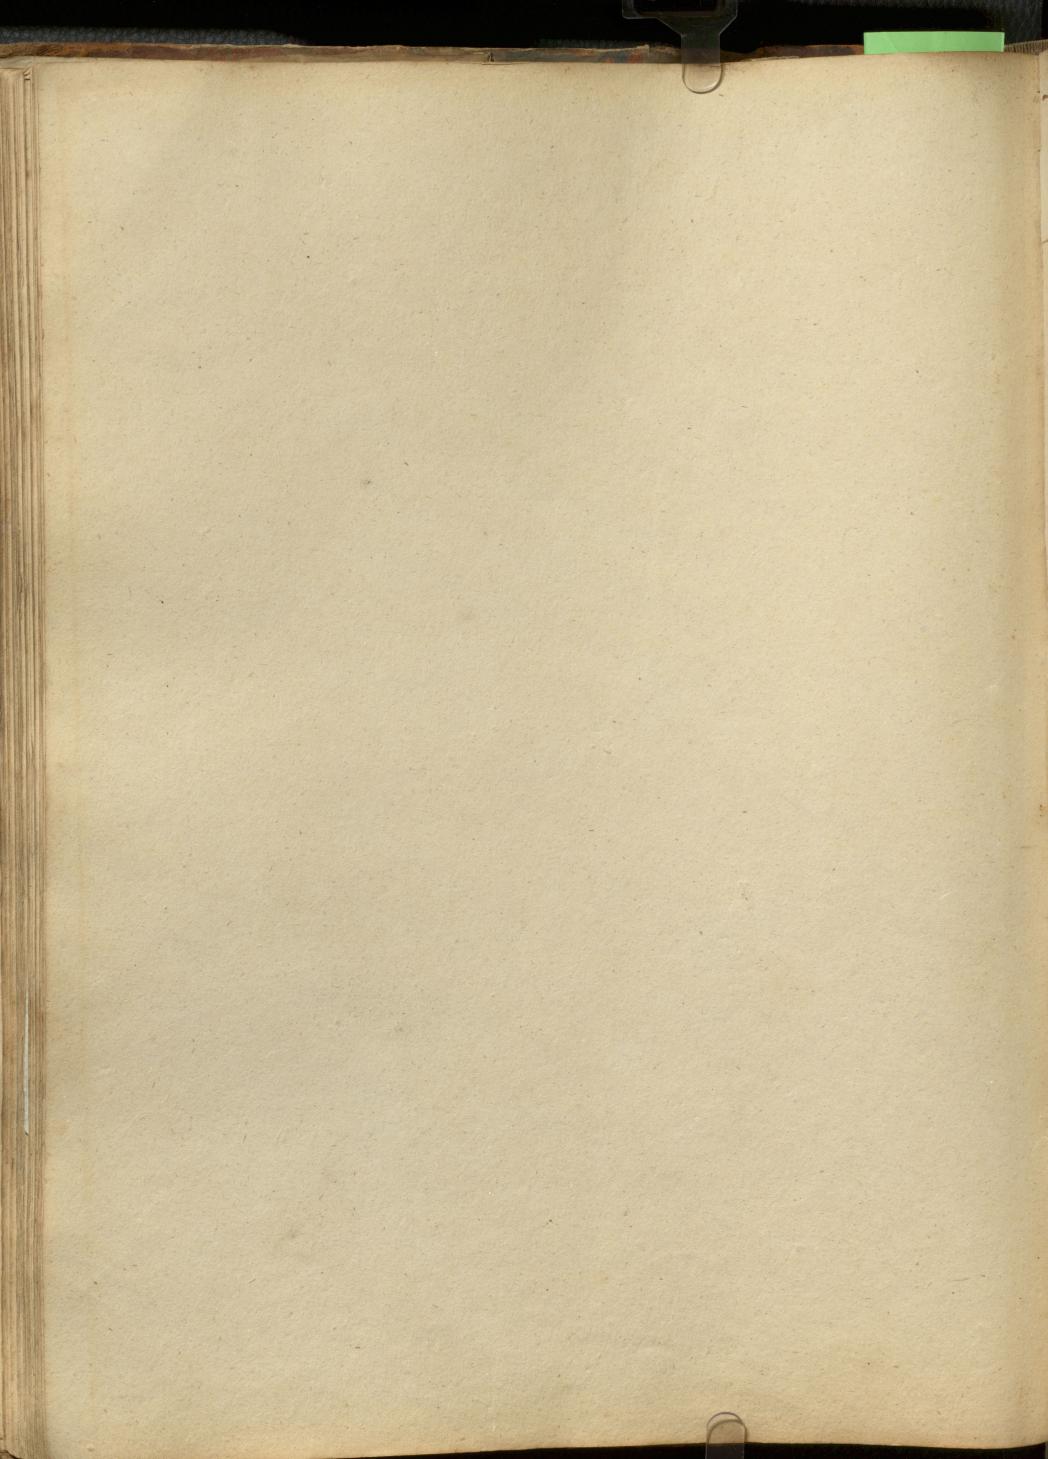

Ry in the act of laying hundred; of Whilelegs on the hairs of horses, while on the wing, they look like way half grague, bond with light brown, had believe 2 wings, the body like a Done - The Jack was probable and with traver to lay each ago. The Hy was I ficult to thinke and tenacroses of life while on the wing is much resembled a bee, and the horse although only touches by a single have at a time, was, sensible of the operation taking place

Examining the loose stones of a throok that come from Dunotes The next day at my leaver. I found the stones that were constantly and as water alcounding in Gadew flees as worms, each about one Juch long and abacked by the tail to the stone, the covering a confileal Roat of made of factured gravel united so as to be done a trugh case when the sheath is found a quel of the coAngella kind howing to Joint including the nich of a orean colour except lowards the head where on the Wast Joints it apreme spets of dark hown and has some few brother. The head which or of a Sardoner hours, has 2 short too strong feeles, and 4 claus like. there of a crab of the same brown colon, a darla shope news down the leagh, they are very fat, and doubtless feed on the Jarfar of the Stone in a sircle the center of which is the tail above which are extretory organo quarded by buther -00 that undoubtedly the grade feed, - and near them I Saw many ledle lungs of gelly, that whends seen to be then now homen -
